

This diagram can help visualize how the list variables and intersections are arranged. Each intersection is bound to its I variable.

This program defines:
 23 word facts
 crossword/11 predicate
 nth/3 predicate
 all_unique/1 predicate

crossword/11 takes in a list of horizontal and vertical slots, and binds words based on four conditions:

- 1.) creates new lists of a fixed length for each word
- 2.) binds words to these lists
- 3.) checks the intersection conditions are met
- 4.) checks each word is unique

nth/3 is a recursive helper predicate that is similar to the nth/3 predicate that comes by default.

all_unique/1 checks each element is unique by checking if it belongs to the remaining list.
